Press Release: Partnership actesy – Modulos AG

Artificial intelligence (AI) is getting more and more popular and is one of the top priorities in most of the Fortune2000 companies as well as gaining more popularity in the SME space. Artificial intelligence is a technology that allows you to learn from your existing data and generalize to new cases. Or simply put, AI allows organizations to make better decisions, improving core business processes by increasing both the speed and accuracy of strategic decision-making processes.

The quality and depth of data determine the level of AI applications you can achieve. This means that poor data quality will only lead to poor AI results or easily spoken: "garbage in results in garbage out". As the dynamic environment of tech-based companies in Switzerland continues to develop, two of them, Modulos and actesy, are joining efforts to help companies using AI as a truly transformational technology and to lower the barriers for its successful deployment in their business models. The goal is to give access to business decision makers to the tools required to make data-driven decisions, without confining AI to the exclusive domain of mathematicians or technical experts.

Modulos platform is designed to create and deploy trustworthy AI applications that are safe, transparent, fair, and developed jointly by business leaders and AI experts, in the seamless effort to add tangible and measurable value to business processes. Modulos takes a revolutionary approach by centering the AI journey on data, rather than models, the so-called Data-Centric AI approach (DCAI), which allows companies to efficiently focus their efforts on repairing flaws on those data that matter for the performance of the specific AI application they want to deploy. The focus on data quality makes it fundamental to have seamless access to the data which are relevant for a given business problem. A software that allows access to data for everyone through an automated process is essential, and just equally important is how that data is being incorporated into the platform.

This is when actesy and Modulos' partnership starts to be interesting: the data integration process needs to be seamless, quick, and easy for everyone and with everything. According to Andreas Imthurn: **"The partnership with Modulos underlines the universal applicability of the actesy integration solution and enables Modulos to integrate all relevant data regardless of the underlying technology or data source."** This partnership opens the door for the democratization of AI applications for all business sizes while guaranteeing highest quality and trustworthiness.

Kevin Schewinski, Modulos CEO and co-founder also sees the partnership as a great opportunity: **"By partnering with actesy we really want companies to lower any barrier to a successful implementation of their AI projects: it all starts with data - from the ingestion to a smarter way to clean them to ensure accurate, fair and robust applications"**

AI enables an unprecedented ability to analyze enormous data sets and computationally discover complex relationships and patterns. AI, augmenting human intelligence, is primed to transform the scientific research process, unleashing a new golden age of scientific discovery in the coming years. Finally, the partnership between Modulos and actesy is a key cornerstone of this development to a more intelligent and quality-based AI world.

At Glance:
Modulos AG was founded as an ETH spin-off by Prof. Ce Zhang and Kevin Schawinski who are determined to make artificial intelligence widely accessible. Modulos AG operates in the AI software industry. The platform is designed to create and deploy trustworthy AI applications that are safe, transparent, fair, and accessible to non-ML experts. Modulos takes a revolutionary approach by centering the AI journey on data, rather than models, the so-called Data-Centric AI (DCAI).

actesy AG was founded as a HSG spin-off by Peter Imthurn, Sandro Secci and Andreas Imthurn who are determined to democratize data access to any system and enabling data orchestration across all of them. actesy is a complete integration and data orchestration framework that connects and orchestrates data and systems independent of the data source and underlying technology.
